

Financial Statement Intelligence

Module 1 • 20 companies • 10 fiscal years each • source: SEC EDGAR XBRL company facts

What this report does

Every figure is pulled directly from filed 10-K data through the SEC EDGAR XBRL API, then cleaned, converted into ratios, described as trends, and scored. Nothing is hand-entered. The Financial Health Score is a weighted blend of five pillars, each metric scored 0 to 100 by linear interpolation between a published floor and ceiling. The full threshold table is in the methodology section at the end, so any score here can be recalculated or disputed.

The ranking below is deliberately not an investment view. It measures reported financial condition against fixed absolute thresholds, which is why capital-intensive and cyclical businesses score lower than asset-light software companies almost by construction. That bias is the single most important thing to understand before quoting any number in this report.

Prof. = Profitability, Lev. = Leverage, Cash = Cash generation, Eff. = Efficiency. Pillar scores are 0 to 100. Bands: 80+ Strong, 65-79 Healthy, 50-64 Adequate, 35-49 Weak, below 35 Distressed.

Sector averages

Sector	Companies	Avg score	Avg net margin	Avg D/E
Communication Services	2	88.5	31.4%	0.19x
Technology	4	74.0	37.0%	1.11x
Consumer Discretionary	3	55.8	7.8%	1.37x

Energy	2	52.8	7.7%	0.02x
Consumer Staples	5	52.5	12.1%	0.71x

The spread across sectors is the evidence for the limitation noted above: the same absolute thresholds flatter some business models and penalise others.

Methodology

Each metric is scored 0 to 100 by linear interpolation between a floor (scores 0) and a ceiling (scores 100), clamped at both ends. Where a lower value is better, the floor is set above the ceiling, which inverts the scale. Metric scores are combined into pillar scores by metric weight, and pillars into the overall score by pillar weight.

Pillar	Pillar weight	Metric	Floor	Ceiling	Metric weight
Profitability	25%	net margin	0%	25%	40%

Known limitations

- **Thresholds are absolute, not sector-relative.** A 25% net margin is exceptional for a grocer and ordinary for enterprise software. Peer-relative scoring is the next module.
- **ROE is distorted by buybacks.** Companies that have bought back stock aggressively show ROE inflated by a shrunk equity base rather than by better returns. Read ROE next to ROA.
- **EPS growth is excluded on purpose.** EDGAR restates only the roughly three years each 10-K covers, so a ten-year EPS series mixes pre- and post-split bases. Revenue and net income growth are used instead because they are unaffected by splits.
- **Four of five pillars use the latest year only.** Growth uses the full-period CAGR. A single unusual year can therefore move the level-based pillars.
- **Unreported metrics are dropped, not guessed.** Where a company does not tag a line item, that metric is excluded and the remaining weights in its pillar are renormalized. Affected companies are flagged on their own page.
- **Financial-sector companies are excluded.** Banks and insurers do not report gross profit and their balance sheets are unclassified, so current ratio and working capital are undefined. They need a different model rather than a looser one.
- **No accounting-quality checks.** Restatements, one-off items and segment changes are not detected. The pipeline trusts what was filed.
